

Odds Tracker Telegram Bot

Tracks live odds (soccer, baseball, table tennis where available) and your own free-bet promos, and sends you Telegram alerts. **It does not place bets for you** — you always bet manually. It also does not scrape bookmaker sites; it uses [The Odds API](#), a legitimate aggregator, so it won't get your betting accounts flagged and won't break every time a bookmaker changes their page.

What it does

- `/odds <sport_key>` — best current price per outcome, across bookmakers
- `/watch <sport_key> <event_id>` — track a match; get pinged when the price moves by 0.05+ in either direction
- `/addfreebet` — log a free bet/promo manually (bookmaker, terms, expiry); get a reminder 48 hours before it expires
- `/sports` — list currently active sport keys the API supports

1. Get your credentials

Telegram bot token:

1. Open Telegram, message [@BotFather](#)
2. Send `/newbot`, follow the prompts
3. Copy the token it gives you

Your Telegram chat ID (so the bot only replies to you):

1. Message [@userinfobot](#)
2. It replies with your numeric ID

Odds API key:

1. Go to <https://the-odds-api.com>
2. Sign up — free tier gives 500 requests/month
3. Copy your API key from the dashboard

2. Configure

Copy `.env.example` to `.env` and fill in the three values above:

```
cp .env.example .env
```

3. Run locally (optional, to test before deploying)

```
pip install -r requirements.txt
python bot.py
```

Message your bot on Telegram, try `/start` and `/sports`.

4. Deploy for 24/7 uptime (Railway — free tier)

1. Push this folder to a new GitHub repo
2. Go to <https://railway.app>, sign in with GitHub
3. "New Project" → "Deploy from GitHub repo" → select your repo
4. In the project's **Variables** tab, add:

- `TELEGRAM_BOT_TOKEN`
- `TELEGRAM_CHAT_ID`
- `ODDS_API_KEY`
- `POLL_INTERVAL_MINUTES` (optional, defaults to 60)

5. Railway auto-detects `railway.json` and runs `python bot.py`

6. Deploy — check the logs for "Bot starting..."

Render alternative: create a new "Background Worker" service, connect the repo, set the same environment variables, and it will use the `Procfile` (`worker: python bot.py`) automatically.

Notes on the free API tier

- 500 requests/month total. Each `/odds` command and each scheduled line-movement check uses one request per sport/event.

- With `POLL_INTERVAL_MINUTES=60` and a handful of watched matches, you'll comfortably stay under the limit. Raise the interval if you add more watches.
- `/sports` is free and doesn't count against your quota.
- Table tennis coverage on the free tier can be thin depending on season — run `/sports` to see what's currently active.

Data storage

Everything (watchlist, odds history, free bets) is stored in a local `oddsbot.db` SQLite file in the deployment. On Railway/Render free tiers this file resets on redeploy — fine for this use case, but let me know if you want it moved to a persistent volume or an external DB.
